

ASSIGNMENT 3

Assignment Title:

Design a dynamic web app like a fashion store / e-commerce product store using HTML, CSS & JavaScript. Also use Bootstrap CDN if required.

1. Objectives

- To create a dynamic e-commerce style web application using HTML, CSS, and JavaScript.
- To implement basic functionality such as product display, add-to-cart operations, dynamic billing, and checkout flow.
- To understand DOM manipulation and event handling in JavaScript.
- To develop a responsive front-end layout similar to a mini online shopping store.

2. Outcomes

After completing this assignment, I was able to:

- Build a functional web app with multiple screens such as Home, Cart, Checkout, and Final Bill.
- Use JavaScript to update UI dynamically (adding items to cart, total calculation, bill generation).
- Organize a project into multiple files ([index.html](#), [style.css](#), [script.js](#)) with a proper folder structure.
- Work with images, grids, buttons, and DOM elements to create an interactive user experience.
- Understand the basics of front-end e-commerce logic.

3. Theory Concept in Brief

1. HTML (Structure Layer)

HTML forms the foundation of the e-commerce application.

It defines components such as:

- Navbar
- Hero section
- Product grid
- Cart section

- Checkout fields
- Bill summary

Each part is structured using semantic HTML tags and containers.

2. CSS (Styling Layer)

CSS enhances the visual appearance of the app.

Using CSS, we created:

- Grid layout for products
- Responsive navbar
- Hover animation on product cards
- Styled buttons, sections, and hero banner
- Clean and user-friendly UI

CSS helps make the app visually appealing and consistent across devices.

3. JavaScript (Dynamic Logic Layer)

JavaScript provides the interactivity needed for a real shopping experience.

Features implemented using JS include:

- Adding items to cart
- Managing cart items using arrays
- Displaying cart dynamically
- Calculating total price
- Simulating checkout and generating a final bill
- Switching between different sections (Home → Cart → Checkout → Bill)

JavaScript manipulates the DOM and updates UI in real-time.

4. Mini E-Commerce Workflow

1. User browses products
2. Adds an item to cart
3. Cart dynamically updates total items and amount
4. User proceeds to checkout
5. Enters name & address
6. Final bill gets displayed

This assignment gives a hands-on understanding of how basic online shopping websites function.

8. Dataset Used

A custom dataset consisting of 6 product images was used.
Example items include smartwatch, shoes, tablet, camera, earbuds, and books.
These images were stored inside the **images** folder.

No external dataset was used.

Tablet

10. Conclusion

In this assignment, I created a dynamic mini e-commerce web application using HTML, CSS, and JavaScript.

The project included multiple features such as product listing, add-to-cart, checkout, and final bill generation. JavaScript played a key role in making the UI interactive and updating the cart dynamically.

This assignment helped me understand how modern online shopping websites work and strengthened my concepts of DOM manipulation, UI design, and front-end logic.
