

Assignment – 2

Title:

Development of a Personal Portfolio Website using HTML and CSS (Bootstrap CDN if needed)

Objectives:

- To create and design a personal portfolio website using HTML and CSS to present personal information, technical skills, and project work.
- To understand how CSS is used for styling elements, managing layouts, selecting fonts, applying colors, and improving overall design.
- To apply responsive design concepts and optionally integrate Bootstrap CDN for better layout and styling support.
- To strengthen practical front-end development skills by building a well-structured and visually attractive portfolio page.

Software / Hardware Requirements:

- A computer or laptop with basic specifications (minimum 4GB RAM suggested).
- Any operating system such as Windows, Linux, or macOS.
- A text editor like Notepad, Visual Studio Code, or Sublime Text for writing HTML and CSS code.
- A web browser such as Google Chrome, Mozilla Firefox, or Microsoft Edge to run and test the website.

Theory:

A personal portfolio website is an essential tool for building a professional online identity. It enables individuals to display their educational qualifications, technical expertise, certifications, and completed projects in an organized manner. A well-structured portfolio enhances credibility and improves opportunities for internships and jobs.

Generally, a portfolio website consists of multiple sections such as Home, About, Skills, Projects, Resume, and Contact. These sections are built using HTML elements like <section>, <div>, headings, paragraphs, images, and anchor tags. Proper organization of these elements ensures better readability and a clean structure.

CSS plays a major role in improving the appearance of the portfolio. It is used to style text, adjust layouts, manage spacing (margin and padding), apply borders, and control positioning. CSS features like Flexbox help in aligning elements efficiently. Visual enhancements such as background colors, font styling, hover effects, and simple animations make the website more attractive and interactive.

Responsive web design ensures that the portfolio works properly on different screen sizes, including smartphones, tablets, and desktop computers. Bootstrap simplifies this process by providing a built-in grid system and ready-made components. By using Bootstrap classes, developers can quickly design responsive layouts without writing extensive CSS.

Bootstrap components like navigation bars, cards, buttons, and forms help create a modern and professional interface. Since many styles are predefined, development becomes faster and more efficient.

In this portfolio project, the contact form is connected using a third-party email service called EmailJS. This service allows emails to be sent directly from the frontend without requiring a backend server. When a user submits the contact form, a JavaScript function captures the entered details such as name, email address, and message. These details are securely sent to the EmailJS server through an API request using a public key and template ID. EmailJS processes the request and forwards the message to my registered email address. After successful submission, a confirmation message is displayed on the webpage.

Conclusion:

In this project, I successfully developed a responsive personal portfolio website using HTML, CSS, and Bootstrap. The website contains structured sections including Home, About, Skills, Projects, and Contact, designed with proper styling and layout techniques.

Additionally, I integrated EmailJS to enable contact form functionality without using a backend server. When a visitor submits the form, the entered information is sent through EmailJS and delivered to my email inbox, along with a success notification shown on the webpage.

This project enhanced my understanding of front-end development concepts and improved my practical skills in building responsive and professional web pages
